led *Papillares*; but that from the tip of the Tongue unto the ſtring there is obſerved none at all.

2. He hath experimented, that if you put *Sal Armoniack* upon the places of the Tongue, where thoſe *Eminencies* are not, you ſhall find no Taſte; but that you will find it preſently, aſſoon you put any ſuch Salt, where they are to be met with. Ergo, *ſaith he*, thoſe *Eminencies* are the principal Organ of Taſte.

3. He aſſures, that with a *Microſcope* may be ſeen in thoſe *Riſings* many little holes, at the bottom whereof there are ſmall nerves, terminating there: But *he directs*, to obſerve this in live and healthy, not in dead or ſick Animals.

Having laid down theſe Obſervations, he concludes, that the manner, after which Taſte is perform'd, is this, That the particles of Salt paſſing through thoſe pores, which pierce the *Papillary Eminences*, and penetrating as far as to the nerves, that meet them there, do by the means of their ſmall points prick them; which pricking is called the *Taſte*.

In the mean time he acknowledges, that before him Signior *Malpighi*, Profeſſor at *Meſſina*, had made ſome of theſe diſcoveries.

The notice of theſe two laſt Books we owe to the *French Journal*.

Correct in Numb. 19.
Pag. 342. lin. 33. read *mixt Ores* in ſtead of, *mixt with Ores*.

Correct in this preſent Numb. 20.
Page 359. line 13. Read *Marle* for *Pearle*.
